Curvature of the determinant line bundle in noncommutative geometry

Masoud Khalkhali

Western University, Canada

Problem: define a function det : A → C which is holomorphic, det D ≠ 0 iff D is invertible, and is gauge invariant.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Problem: define a function det : A → C which is holomorphic, det D ≠ 0 iff D is invertible, and is gauge invariant.

 Holomorphic anomaly: gauge invariance and holomorphy don't mix well. So drop gauge invariance.

Problem: define a function det : A → C which is holomorphic, det D ≠ 0 iff D is invertible, and is gauge invariant.

 Holomorphic anomaly: gauge invariance and holomorphy don't mix well. So drop gauge invariance.

• Zeta regularized determinant: For  $D \in A$ , let  $\Delta = D^*D$ .

spectrum of  $\Delta$  :  $0 \leq \lambda_0 \leq \lambda_1 \leq \lambda_2 \leq \cdots \rightarrow \infty$ 

Problem: define a function det : A → C which is holomorphic, det D ≠ 0 iff D is invertible, and is gauge invariant.

 Holomorphic anomaly: gauge invariance and holomorphy don't mix well. So drop gauge invariance.

- Zeta regularized determinant: For  $D \in A$ , let  $\Delta = D^*D$ .
  - spectrum of  $\Delta: \qquad 0 \leq \lambda_0 \leq \lambda_1 \leq \lambda_2 \leq \cdots \rightarrow \infty$

Spectral zeta function:

$$\zeta_{\Delta}(s) = \sum rac{1}{\lambda_i^s}, \qquad {\it Re}(s) \gg 0$$

• Assume:  $\zeta_{\Delta}(s)$  has meromorphic extension to  $\mathbb{C}$  and is regular at 0.

- Assume:  $\zeta_{\Delta}(s)$  has meromorphic extension to  $\mathbb{C}$  and is regular at 0.
- > Zeta regularized determinant:

$$\log \det_{\zeta}(\Delta) = -\zeta_{\Delta}'(0), \qquad \prod \lambda_i = e^{-\zeta_{\Delta}'(0)}$$

- Assume:  $\zeta_{\Delta}(s)$  has meromorphic extension to  $\mathbb{C}$  and is regular at 0.
- Zeta regularized determinant:

$$\log \det_{\zeta}(\Delta) = -\zeta'_{\Delta}(0), \qquad \prod \lambda_i = e^{-\zeta'_{\Delta}(0)}$$

• Example: 
$$\infty! = 1 \cdot 2 \cdot 3 \cdots = \sqrt{2\pi}$$

- Assume:  $\zeta_{\Delta}(s)$  has meromorphic extension to  $\mathbb{C}$  and is regular at 0.
- Zeta regularized determinant:

$$\log \det_{\zeta}(\Delta) = -\zeta_{\Delta}'(0), \qquad \prod \lambda_i = e^{-\zeta_{\Delta}'(0)}$$

• Example: 
$$\infty! = 1 \cdot 2 \cdot 3 \cdots = \sqrt{2\pi}$$

• But 
$$D \rightsquigarrow \sqrt{\det \Delta}$$
 is not holomorphic!

- Assume:  $\zeta_{\Delta}(s)$  has meromorphic extension to  $\mathbb{C}$  and is regular at 0.
- Zeta regularized determinant:

$$\log \det_{\zeta}(\Delta) = -\zeta_{\Delta}'(0), \qquad \prod \lambda_i = e^{-\zeta_{\Delta}'(0)}$$

• Example: 
$$\infty! = 1 \cdot 2 \cdot 3 \cdots = \sqrt{2\pi}$$

• But 
$$D \rightsquigarrow \sqrt{\det \Delta}$$
 is not holomorphic!

▶ Quillen's approach: based on determinant line bundle.

## The determinant line

• Let  $\lambda = \text{top exterior power functor}$ . Given  $T: V \to W$ , let

 $\lambda T : \lambda V \to \lambda W$ ,

 $\det T := \lambda T \in (\lambda V)^* \otimes \lambda W \quad \leftarrow \text{ determinant line}$ 

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

#### The determinant line

• Let  $\lambda = \text{top exterior power functor. Given } T : V \to W$ , let

$$\begin{split} \lambda T : \lambda V \to \lambda W, \\ \det T := \lambda T \in (\lambda V)^* \otimes \lambda W & \leftarrow \text{ determinant line} \end{split}$$

▶ Goal: globalize this and construct a line bundle Det → Fred over Fredholm operators s.t.

$$\mathsf{Det}_T \simeq \lambda(\mathit{ker}T)^* \otimes \lambda(\mathit{coker}T)$$

# The determinant line bundle

Space of Fredholm operators:

$$F = \operatorname{Fred}(H_0, H_1) = \{T : H_0 \rightarrow H_1; \ T \text{ is Fredholm}\}$$
  
 $\mathcal{K}_0(X) = [X, F]$ 

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

# The determinant line bundle

Space of Fredholm operators:

$$F = \operatorname{Fred}(H_0, H_1) = \{T : H_0 \rightarrow H_1; \ T \text{ is Fredholm}\}$$
  
 $\mathcal{K}_0(X) = [X, F]$ 

► Theorem (Quillen) 1) There is a holomorphic line bundle DET → F s.t.

$$(DET)_T = \lambda (KerT)^* \otimes \lambda (KerT^*)$$

### The determinant line bundle

Space of Fredholm operators:

$$F = \operatorname{Fred}(H_0, H_1) = \{T : H_0 \rightarrow H_1; \ T \text{ is Fredholm}\}$$
  
 $K_0(X) = [X, F]$ 

► Theorem (Quillen) 1) There is a holomorphic line bundle DET → F s.t.

$$(DET)_T = \lambda (KerT)^* \otimes \lambda (KerT^*)$$

2) There map  $\sigma: F_0 \rightarrow DET$ 

$$\sigma(T) = \begin{cases} 1 & T & invertible \\ 0 & otherwise \end{cases}$$

is a holomorphic section of DET over  $F_0$ .

## Sketch proof

• Open cover: Fred =  $\bigcup U_F$ ,  $dim F < \infty$ ,

 $U_F = \{T \in \mathsf{Fred}; Im(T) + F = H\}$ 

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

### Sketch proof

▶ Open cover: Fred =  $\bigcup U_F$ ,  $dimF < \infty$ ,  $U_F = \{T \in \text{Fred}; Im(T) + F = H\}$ 

► Over *U<sub>F</sub>* define

$$\operatorname{Det}_T = \lambda(T^{-1}F)^* \otimes \lambda(F)$$

▶ Fact: These glue together nicely to define a lie bundle over Fred.

$$0 \rightarrow Ker(T) \rightarrow T^{-1}F \rightarrow F \rightarrow coker(T) \rightarrow 0$$

shows that

$$\mathsf{Det}_{\mathcal{T}} \simeq \lambda(\mathsf{ker}\mathcal{T})^* \otimes \lambda(\mathsf{coker}\mathcal{T})$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

### From det section to det function

 $\blacktriangleright$  Use elliptic theory to pull back DET to a holomorphic line bundle  $\mathcal{L} \to \mathcal{A}$  with

 $\mathcal{L}_D = \lambda (\mathit{KerD})^* \otimes \lambda (\mathit{KerD}^*).$ 

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

### From det section to det function

• Use elliptic theory to pull back DET to a holomorphic line bundle  $\mathcal{L} \to \mathcal{A}$  with

$$\mathcal{L}_D = \lambda(\mathit{KerD})^* \otimes \lambda(\mathit{KerD}^*).$$

• If  $\mathcal{L}$  admits a canonical global section *s*, then

$$\sigma(D) = \det(D)s$$

defines a holomorphic determinant. s is defined once we have a canonical flat connection.

Families of Cauchy-Riemann operators

•  $E \rightarrow M$  smooth vector bundle over a compact Riemann surface.

 $\Omega^{p,q}(E)$  (p,q) - forms with coefs. in E

Families of Cauchy-Riemann operators

•  $E \rightarrow M$  smooth vector bundle over a compact Riemann surface.

$$\Omega^{p,q}(E)$$
  $(p,q)$  - forms with coefs. in E

• Let  $\mathcal{A} =$  space of  $\overline{\partial}$ -connections  $D : \Omega^{0,0}(E) \to \Omega^{0,1}(E)$  on E.

$$D = \bar{\partial} + A, \qquad A \in \Omega^{0,1}(End(E))$$

It is an affine space over  $\mathcal{B} = \Omega^{0,1}(\text{End}(E))$ .

 $\mathcal{A}/\mathcal{G} \simeq \{ \text{holomorphic structures on } E \}$ 

# Quillen's metric

> D is an elliptic 1st order PDE and defines a Fredholm operator

 $D: L^2(E) 
ightarrow W^1(\Omega^{0,1}(E)), \quad D \in \operatorname{Fred}(H_0,H_1)$ 

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶

## Quillen's metric

D is an elliptic 1st order PDE and defines a Fredholm operator

$$D: L^2(E) \rightarrow W^1(\Omega^{0,1}(E)), \quad D \in \operatorname{Fred}(H_0, H_1)$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

▶ This defines a map  $f : A \to Fred(H_0, H_1)$ . Pull back DET along f $\mathcal{L} := f^*(DET)$ 

•  $\mathcal{L}$  is a holomorphic line bundle over  $\mathcal{A}$ .

## Quillen's metric on $\mathcal{L}$

Define a metric on *L*, using regularized determinants. Pick an o. n. basis for ker(D) and ker(D<sup>\*</sup>). Get a basis v for *L<sub>D</sub>* ≃ λ(kerD)<sup>\*</sup> ⊗ λ(kerD<sup>\*</sup>). Let

$$||v||^2 = \exp(-\zeta'_{\Delta}(0)) = \det\Delta.$$

▶ Prop: This defines a smooth Hermitian metric on *L*.

## Quillen's metric on $\mathcal{L}$

Define a metric on *L*, using regularized determinants. Pick an o. n. basis for ker(D) and ker(D<sup>\*</sup>). Get a basis v for *L<sub>D</sub>* ≃ λ(kerD)<sup>\*</sup> ⊗ λ(kerD<sup>\*</sup>). Let

$$||v||^2 = \exp(-\zeta'_{\Delta}(0)) = \det\Delta.$$

▶ Prop: This defines a smooth Hermitian metric on *L*.

A Hermitian metric on a holomorphic line bundle has a unique compatible connection. Its curvature can be computed from

 $\bar{\partial}\partial \log ||s||^2$ ,

where s is any local holomorphic frame.

## The curvature of $\ensuremath{\mathcal{L}}$

• A Hermitian metric on  $\mathcal{B} = \Omega^{0,1}(EndE)$ 

$$||B||^2 = \frac{i}{2\pi} \int_M Tr_E(B^*B)$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶

where  $B = \alpha(z) d\overline{z}$ ,  $B^* = \alpha(z)^* dz$ .

## The curvature of $\ensuremath{\mathcal{L}}$

• A Hermitian metric on  $\mathcal{B} = \Omega^{0,1}(EndE)$ 

$$||B||^2 = \frac{i}{2\pi} \int_M Tr_E(B^*B)$$

where  $B = \alpha(z) d\overline{z}$ ,  $B^* = \alpha(z)^* dz$ .

▶ Kaehler form of  $\mathcal{A}$ . Fix  $D_0 \in \mathcal{A}$ , let  $q(D) = ||D - D_0||^2$ , and

$$\omega = \partial \bar{\partial} q.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶

## The curvature of $\ensuremath{\mathcal{L}}$

• A Hermitian metric on  $\mathcal{B} = \Omega^{0,1}(EndE)$ 

$$||B||^2 = \frac{i}{2\pi} \int_M Tr_E(B^*B)$$

where  $B = \alpha(z) d\overline{z}$ ,  $B^* = \alpha(z)^* dz$ .

▶ Kaehler form of A. Fix  $D_0 \in A$ , let  $q(D) = ||D - D_0||^2$ , and

$$\omega = \partial \bar{\partial} q.$$

Theorem (Quillen): The curvature of the determinant line bundle is the symplectic form ω.

# A holomorphic determinant

Modify the metric to get a flat connection:

$$||s||_{f}^{2} = e^{||D-D_{0}||^{2}}||s||^{2}$$

## A holomorphic determinant

Modify the metric to get a flat connection:

$$||s||_{f}^{2} = e^{||D-D_{0}||^{2}}||s||^{2}$$

 Get a flat holomorphic global section of norm 1. This gives a holomorphic determinant function

$$det(D, D_0) : \mathcal{A} \to \mathbb{C}$$

It satisfies

$$|det(D, D_0)|^2 = e^{||D - D_0||^2} det_{\zeta}(D^*D)$$

# Cauchy-Riemann operators on $\mathcal{A}_{\theta}$

where  $\operatorname{res}(P_{\sigma}) := \int_{|\xi|=1} \sigma_{-2}(\xi) d\xi$ .

# Noncommutative residue

The Wodzicki residue of a classical pseudodifferential operator P<sub>σ</sub> is defined as

$$\operatorname{Res}(P_{\sigma}) = \varphi_0\left(\operatorname{res}(P_{\sigma})\right),\,$$

where  $\operatorname{res}(P_{\sigma}) := \int_{|\xi|=1} \sigma_{-2}(\xi) d\xi$ .

 t is evident from its definition that Wodzicki residue vanishes on differential operators and on non-integer order classical pseudodifferential operators.

# A cutoff integral

• Any pseudo of order < -2 is trace-class with

$$\operatorname{Tr}(P) = \varphi_0\left(\int_{\mathbb{R}^2} \sigma_P(\xi) d\xi\right).$$

## A cutoff integral

▶ Any pseudo of order < -2 is trace-class with

$$\operatorname{Tr}(P) = \varphi_0\left(\int_{\mathbb{R}^2} \sigma_P(\xi) d\xi\right).$$

For ord(P) ≥ -2 the integral is divergent, but, assuming P is classical, one has an asymptotic expansion as R → ∞

$$\int_{B(R)} \sigma(\xi) d\xi \sim \sum_{j=0,\alpha-j+2\neq 0}^{\infty} \alpha_j(\sigma) R^{\alpha-j+2} + \beta(\sigma) \log R + c(\sigma),$$

where  $\beta(\sigma) = \int_{|\xi|=1} \sigma_{-2}(\xi) d\xi$ .

# The Kontsevich-Vishik trace

The cut-off integral of a symbol σ ∈ S<sup>α</sup><sub>cl</sub>(A<sub>θ</sub>) is defined to be the constant term in the above asymptotic expansion, and we denote it by f σ(ξ)dξ.

(ロ)、(型)、(E)、(E)、 E) の(の)

### The Kontsevich-Vishik trace

The cut-off integral of a symbol σ ∈ S<sup>α</sup><sub>cl</sub>(A<sub>θ</sub>) is defined to be the constant term in the above asymptotic expansion, and we denote it by f σ(ξ)dξ.

The canonical trace of a classical pseudo P ∈ Ψ<sup>α</sup><sub>cl</sub>(A<sub>θ</sub>) of non-integral order α is defined as

$$\operatorname{TR}(P) := \varphi_0\left(\int \sigma_P(\xi) d\xi\right).$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

### The Kontsevich-Vishik trace

The cut-off integral of a symbol σ ∈ S<sup>α</sup><sub>cl</sub>(A<sub>θ</sub>) is defined to be the constant term in the above asymptotic expansion, and we denote it by f σ(ξ)dξ.

The canonical trace of a classical pseudo P ∈ Ψ<sup>α</sup><sub>cl</sub>(A<sub>θ</sub>) of non-integral order α is defined as

$$\operatorname{TR}(P) := \varphi_0\left(\int \sigma_P(\xi)d\xi\right).$$

Theorem: The functional TR is the analytic continuation of the ordinary trace on trace-class pseudodifferential operators. Let A ∈ Ψ<sup>α</sup><sub>cl</sub>(A<sub>θ</sub>) be of order α ∈ Z and let Q be a positive elliptic classical pseudodifferential operator of positive order q. We have

$$\operatorname{Res}_{z=0}\operatorname{TR}(AQ^{-z}) = \frac{1}{q}\operatorname{Res}(A).$$

Let A ∈ Ψ<sup>α</sup><sub>cl</sub>(A<sub>θ</sub>) be of order α ∈ Z and let Q be a positive elliptic classical pseudodifferential operator of positive order q. We have

$$\operatorname{Res}_{z=0}\operatorname{TR}(AQ^{-z}) = \frac{1}{q}\operatorname{Res}(A).$$

Proof: For the holomorphic family σ(z) = σ(AQ<sup>-z</sup>), z = 0 is a pole for the map z → f σ(z)(ξ)dξ whose residue is given by

$$\operatorname{Res}_{z=0}\left(z\mapsto \int \sigma(z)(\xi)d\xi\right) = -\frac{1}{\alpha'(0)}\int_{|\xi|=1}\sigma_{-2}(0)d\xi$$
$$= -\frac{1}{\alpha'(0)}\operatorname{res}(A).$$

Taking trace on both sides gives the result.

Prop: We have TR(AB) = TR(BA) for any A, B ∈ Ψ<sub>cl</sub>(A<sub>θ</sub>), provided that ord(A) + ord(B) ∉ Z.

# Variations of LogDet and the curvature form

Recall: for our canonical section

$$\|\sigma\|^2 = e^{-\zeta'_{\Delta_\alpha}(0)}$$

• Consider a holomorphic family of Cauchy-Riemann operators  $D_w = \bar{\partial} + \alpha_w$ , and compute

$$\bar{\partial}\partial \log \|\sigma\|^2 = \delta_{\bar{w}}\delta_w\zeta'_{\Delta}(0) = \delta_{\bar{w}}\delta_w\frac{d}{dz}\mathrm{TR}(\Delta^{-z})|_{z=0}.$$

### Variations of LogDet and the curvature form

Recall: for our canonical section

$$\|\sigma\|^2 = e^{-\zeta'_{\Delta_\alpha}(0)}$$

• Consider a holomorphic family of Cauchy-Riemann operators  $D_w = \bar{\partial} + \alpha_w$ , and compute

$$ar{\partial}\partial \log \|\sigma\|^2 = \delta_{ar{w}}\delta_w\zeta'_\Delta(0) = \delta_{ar{w}}\delta_wrac{d}{dz}\mathrm{TR}(\Delta^{-z})|_{z=0}.$$

The first variational formula is given by

$$\delta_w \zeta(z) = \delta_w \operatorname{TR}(\Delta^{-z}) = \operatorname{TR}(\delta_w \Delta^{-z}) = -z \operatorname{TR}(\delta_w \Delta \Delta^{-z-1}).$$

 $\blacktriangleright$  Using the properties of TR, we have

$$\begin{split} \delta_w \zeta'(0) &= \left. \frac{d}{dz} \delta_w \zeta(z) \right|_{z=0} = \\ &-\varphi_0 \left( \int \sigma(\delta_w \Delta \Delta^{-1}) - \frac{1}{2} \mathrm{res} \left( \delta_w \Delta \Delta^{-1} \log \Delta \right) \right). \end{split}$$

The curvature of the determinant line bundle

For a holomorphic family of Cauchy-Riemann operators D<sub>w</sub>, the second variation of ζ'(0) is given by :

$$\delta_{\bar{w}}\delta_{w}\zeta'(0) = \frac{1}{2}\varphi_{0}\left(\delta_{w}D\delta_{\bar{w}}\operatorname{res}(\log\Delta D^{-1})\right).$$

The curvature of the determinant line bundle

For a holomorphic family of Cauchy-Riemann operators D<sub>w</sub>, the second variation of ζ'(0) is given by :

$$\delta_{\bar{w}}\delta_{w}\zeta'(0) = \frac{1}{2}\varphi_{0}\left(\delta_{w}D\delta_{\bar{w}}\operatorname{res}(\log\Delta D^{-1})\right).$$

Using the symbol calculus and properties of the canonical trace we prove:

Theorem (A. Fathi, A. Ghorbanpour, MK.) The curvature of the determinant line bundle for the noncommutative two torus is given by

$$\delta_{\bar{w}}\delta_w\zeta'(0)=\frac{1}{4\pi\Im(\tau)}\varphi_0\left(\delta_w D(\delta_w D)^*\right).$$
